X_i is the number of scedlings observed in quadrat #i. $X_i, ..., X_n \stackrel{\text{lid}}{\sim} Poisson(2)$

Goal: a confidence intoval for λ based on the large-scape normal approx, to the sampling distribution of $\hat{\Lambda}^{MLE} = \bar{X} = \frac{1}{N} \cdot \hat{\Sigma} \cdot X$:

The normal approx, is,

 $\hat{\Delta}^{MLE} \sim Normal(\lambda, \frac{1}{J(\hat{\lambda}^{MLE})})$

Sobsered Fisher intermeters essaluated at ince (estimate based on observed sample data)

$$J(\lambda^{*}) = -\frac{d^{2}}{d\lambda^{2}} \left| \log \left\{ \prod_{i=1}^{n} f_{X_{i}}(x_{i}|\lambda) \right\} \right|_{\lambda=\lambda^{*}}$$

$$= -\frac{d^{2}}{d\lambda^{2}} \sum_{i=1}^{n} \left| \log \left\{ \frac{e^{-\lambda} \lambda^{x_{i}}}{x_{i}!} \right\} \right|_{\lambda=\lambda^{*}}$$

$$= -\frac{d^{2}}{d\lambda^{2}} \sum_{i=1}^{n} \left\{ -\lambda + x_{i} \log(\lambda) - \log(x_{i}!) \right\} \Big|_{\lambda=\lambda^{*}}$$

$$\left[\hat{\Lambda}^{MLE} - 2(1-\frac{4}{2})\sqrt{\frac{\pi}{n}}\right]$$

This will not have a actual confidence level of (1- x) 4100% because it's based on a normal approximation to the distribution of the proofed quantity not the actual distribution of Λ

Def: The nominal confidence level (or the nominal coverage rede) of a confidence indualis the claimed proportion of samples for which the interval condains the actual value of the parameter being estimated.

(1-4) # 100%

Comment: If the confidence introval was derived based on an approximate sampling distribution, the actual coverage rate (or confidence level) may be different from the nominal coverage rate.
